GLUE: Graduates Linked with Undergraduates in Engineering

Ms. Tricia S. Berry, Dr. Kerry A. Kinney
The University of Texas at Austin

Abstract
The Women in Engineering Program at The University of Texas at Austin is in the third year of developing, managing and expanding a hands-on, seminar-based undergraduate research program, Graduates Linked with Undergraduates in Engineering (GLUE) – Sticking with Engineering Through Undergraduate Research. GLUE undergraduate student participants are matched by major and interest area with a graduate student for the spring semester. The undergraduate participant works with the graduate student on a research project three to five hours per week and attends a weekly seminar focused on research opportunities, graduate school issues and career development topics. Undergraduate students gain engineering and research experience while earning engineering course credit. Graduate students participate in mentor training and skills development workshops while gaining teaching and supervisory experience and enhancing their communication skills. This paper describes the GLUE program including planning and administration, assessment, and corporate and university partnerships.

The GLUE program has been successful at UT Austin and has expanded from 13 undergraduate student applicants, 13 mentor-mentee pairs and $4,500 in funding in 2003 to 68 undergraduate student applicants, 34 mentor-mentee pairs and $53,000 in funding in 2005. Undergraduate participants show an increase in the likelihood of attending graduate school after participating in the GLUE program. As for the graduate students who serve as mentors in the program, over 60% of the participants report an improvement in their teaching and communication skills as a result of the program. The GLUE program has become an integral retention and career development initiative for WEP and the College of Engineering at UT Austin.

Introduction
Although The University of Texas at Austin (UT Austin) has an excellent graduate program in engineering, many of our undergraduate students know very little about the research going on at our university. Misconceptions about graduate school and research careers are common among the undergraduate population. This lack of knowledge proves to be a real barrier that prevents many undergraduate students, and female and minority students, in particular, from considering graduate school. The Graduates Linked with Undergraduates in Engineering (GLUE) program provides an innovative opportunity to expose undergraduate engineering students to research by linking them with graduate engineering students working on research projects in the College of Engineering. The program consists of a semester-long research experience coupled with a structured interdisciplinary seminar course for the undergraduate participants. The program is primarily intended for undergraduates with little to no previous research and engineering
experience who have at least one year remaining before graduation. Specific objectives of the GLUE program are as follows:

1. Involve undergraduate engineers in the engineering research being conducted at The University of Texas at Austin;
2. Increase the number of female engineering students pursuing graduate degrees and research careers;
3. Introduce undergraduate students to engineering graduate students, faculty and research practitioners in industry;
4. Expose students to real-world issues of importance to engineers; and
5. Provide mentoring and teaching opportunities for graduate students in engineering.

A successful pilot of the GLUE program was completed in Spring 2003 with a total of 26 undergraduate and graduate participants (13 pairs) and two sponsors providing $4,500 in funding. A formal course for the program was established in Spring 2004 with a total of 42 participants (21 pairs) from six engineering departments and sponsorship of $23,400 from five companies. The Spring 2005 program encompasses all UT Austin College of Engineering departments with 68 participants (34 pairs). Sponsorship for the 2005 program totals $53,400 from six corporate sponsors and one government-funded consortium sponsor.

**Program Components**
The GLUE program consists of graduate mentor recruitment, undergraduate participant recruitment and selection, the research experience and seminar course, outreach activities and graduate mentor workshops. Table 1 details the timeline for the GLUE program.

*Graduate Mentor Recruitment.* Graduate student mentors are recruited beginning in October, prior to opening the applications for undergraduate participants. All female graduate students in the College of Engineering are emailed and encouraged to participate and faculty and department chairs are notified about the opening of the graduate mentor applications. Graduate mentors complete an online application providing information on their research projects, faculty advisors, previous mentoring experience, past undergraduate research experience and motivation behind participating as a mentor in the GLUE program. The number of undergraduate participants is limited by the number of graduate students interested and willing to participate as volunteers and mentors in the GLUE program.
**Undergraduate Participant Selection.** Undergraduate students are initially recruited by WEP through targeted email advertisements to second and third year engineering women beginning in November for the spring GLUE program. If the targeted number of students is not reached after the initial advertising campaign, advertisements broaden to non-graduating senior women, followed by minority male students and eventually include all engineering students. Undergraduate participants complete an online application detailing their area of interest, previous research and engineering experience, previous contact with female graduate students and faculty, current career plans and expectations for the program. Students are selected based on the following criteria:

1. Application order (first come, first served provided the remaining criteria are met)
2. Research interests match with a graduate mentor’s project
3. Second or third year classification (priority over first year and senior level students)
4. No prior research experience

With the targeted advertisement campaign, the percentage of female students participating greater than the pool – 77 percent of participants are women compared to a pool of 22 percent women). Undergraduate students accepted into the program are given clearance to enroll in the seminar course beginning in January, thus enabling WEP to control enrollment.

**Research Experience.** The undergraduates participating in the GLUE program work 3 to 5 hours per week on a research project with their graduate student mentor throughout the spring semester. Projects are determined by matching the undergraduate student’s stated interests with a graduate student working in that area with the desire that a mentor-mentee relationship develops between each undergraduate student and her graduate student mentor as a result of working together on a research project of mutual interest. Undergraduate students are encouraged to attend graduate seminars, research group meetings or meetings with the graduate student mentor’s advisor to gain a better understanding of graduate school and research. The undergraduate participants keep written logs throughout the semester to document their work and to reflect on their research experience. The logs are submitted biweekly and reviewed by the GLUE coordinators to track student progress.

**Interdisciplinary Seminar Course.** To supplement the experience the undergraduates receive working with their graduate mentors in the laboratory, the undergraduate GLUE students participate in a structured weekly seminar course throughout the semester. The reason for formalizing the program into a course is twofold: (1) undergraduates are used to working within the structure of a course and thus understand the responsibilities involved; and (2) the course codifies the program which will contribute to the longevity of the program since it is now “in the catalogue”. The course description for the two unit, pass/no-pass course is as follows:

*Research Experience for Undergraduates:* Undergraduate students work 3 to 5 hours per week with graduate students on engineering research projects. Topics for the research experience are arranged at the beginning of each semester for each undergraduate/graduate student pair and may include conducting laboratory experiments and developing computer models. Mandatory seminar meetings related to the engineering profession, engineering ethics, as well as research
career tracks in industry and academia will be held weekly. Students keep written logs documenting their research experience and reflections on weekly seminars and regularly present their research experiences and projects to the interdisciplinary class.

Each GLUE student formally presents their research project to the rest of the class at least two times during this course. The students learn to present their work to a broad, interdisciplinary audience and are exposed to the wide variety of research currently underway in the College of Engineering. Outside speakers are invited to present in other seminars to provide a broader perspective on topics relevant to engineering students who are considering pursuing an advanced degree or opportunities in research both in academia and industry (See Table 2).

**Outreach Activities.** In addition to the research experience and seminar course, the GLUE program expanded for the Spring 2005 class to include outreach activities. The GLUE undergraduate and graduate students participate in either Introduce a Girl to Engineering Day, the outreach effort during Engineers Week to introduce pre-college girls to engineering, or Explore UT, the university-wide open house during which the College of Engineering shares projects, research and hands-on activities with the public.

**Graduate Mentor Workshops.** While graduate students participate in GLUE on a volunteer basis, the program gives the graduate students the opportunity to improve their teaching, communication and project management skills. In order to further increase the value of the program to the graduate students, participants are invited to participate in two Graduate Mentor Workshops on topics such as “Research Supervisory Skills” and “Negotiating Your First Position.” These workshops are in addition to the mentor training conducted at the beginning of the semester aimed at detailing the program to the graduate students, providing an opportunity for past mentors to share experiences and successes, and answering questions.

**Program Administration**

The GLUE program falls under the retention and community-building program umbrella of the Women in Engineering Program (WEP) at UT Austin. The program is administered through WEP in collaboration with Dr. Kerry Kinney, Associate Professor in the Civil Engineering Department at UT Austin. Dr. Kinney serves as the faculty instructor for the interdisciplinary
course associated with the GLUE program and works with the WEP to recruit the undergraduate and graduate students for the program. Women in Engineering Program staff are responsible for advertising the program, evaluating application forms, matching students and projects, managing student coordinators and a Web developer, assessing and evaluating the course as well as disseminating and maintaining corporate funding.

Program Assessment
In order to evaluate the GLUE program and to determine if the goals of the program are being met, a variety of survey instruments and sources of data were used as described below.

Undergraduate Assessment and Evaluation. Undergraduate participants complete pre-surveys as part of the GLUE application to assess their level of research experience, exposure to graduate students, faculty, research and the graduate school process, current career plans and expectations for the program. At the conclusion of the program, undergraduate students complete a post-survey to assess their satisfaction with the program, exposure to graduate students, faculty, research and the graduate school processes and current career plans.

Sample Questions from the Undergraduate Participant Pre-Survey
- Have you had previous undergraduate research experience?
- Have you interacted with any female engineering faculty while in college?
- Have you been mentored by a graduate student?

Sample Questions from the Undergraduate Participant Post-Survey
- Do you plan to do undergraduate research in future semesters?
- How do you feel your perception of graduate school has changed over the semester?
- How often did you interact with other graduate students besides your mentor?
- What are your career plans after graduating with your BS degree?

Graduate Assessment and Evaluation. Graduate mentors also complete pre-surveys to assess their previous mentoring and undergraduate research experiences and their current career plans. At the conclusion of the program, graduate students completed a post-survey to assess their satisfaction with the program, perceived increase in teaching or mentoring, and career plans.

Sample Questions from the Graduate Mentor Pre-Survey
- Have you had previous experience mentoring undergraduates?
- Were you mentored by a graduate student when you were an undergraduate?
- Did you participate in undergraduate research as an undergraduate?

Sample Questions from the Graduate Mentor Post-Survey
- What skills do you feel that you have gained, if any, during your participation in the GLUE program?
- As an experienced GLUE mentor, what advice would you give to a new GLUE mentor?
- What are your career plans after graduating with your graduate degree?
Undergraduate Participants

**Participant Demographics.** Demographics of the undergraduate participants in the GLUE program over the three years of the GLUE program (2003, 2004 and 2005) are summarized in Table 3. Women are participating at a rate of 76 percent compared to the overall College of Engineering undergraduate enrollment of approximately 22 percent. Minority students (African American, Hispanic and Native American) are participating at a rate of nearly 18 percent, matching the overall College of Engineering undergraduate enrollment.

**Pre-Survey Data.** Undergraduate students completed an application form that contains questions assessing their research experience. Sixty-eight student participants have been surveyed to date from the 2003, 2004 and 2005 GLUE programs. Survey highlights are below:

- 10 percent had previously participated in research;
- 49 percent had previously interacted with a female faculty member;
- 37 percent had previously interacted with a female graduate student;
- 3 percent had previously been mentored by a graduate student; and
- 32 percent have interned or co-oped previously.

Students were also asked on the pre-survey about their career plans upon graduation. Below are the results from the sixty-eight participants:

- 38 percent plan to attend graduate school and then head into academia or industry;
- 32 percent plan to head into industry and then get an MBA or attend graduate school;
- 25 percent are undecided;
- 3 percent plan to head into industry; and
- 1 percent plans to head into medical school.
**Post-Survey and Graduation Data.** Thirty-four undergraduate students have completed the GLUE program to date (Spring 2003 and Spring 2004 participants). Post-survey results from completed surveys as well as graduation information are below:

- 47 percent have graduated with an engineering degree (the remaining students are still in the engineering program);
- 26 percent have taken the GRE and either have applied to graduate school or are attending graduate school in engineering;
- 63 percent plan to attend graduate school and then head into academia or industry;
- 25 percent plan to head into industry and then get an MBA or attend graduate school; and
- 13 percent are undecided.

**Participant Feedback.** The program is currently in its third year and feedback from previous participants in the program has been overwhelmingly positive. A sampling of quotes from previous participants is provided below.

“After the faculty panel, I actually thought what it might be like to become a professor; something that I’ve never done before. The student and industry panel also helped me realize that there is more than one way to go through graduate school, either the research route, or the non-research route. I had never realized there was a choice, but having the option to make it through school more quickly if I needed to was very comforting.”

“I am incredibly thankful because GLUE has not only given me the opportunity to work on an interesting project, but it has also encouraged me to pursue graduate school. My graduate mentor has been a wonderful source to ask questions and express my concerns about graduate school. I have been motivated from listening to her experiences and observing how much she enjoys her research, courses and professors.”

“I really got to see first hand how versatile studying electrical engineering could be and how it could be applied in various ways of research. GLUE has opened the door to many other opportunities for me and has made a positive impact on my semester and my decisions for the future. The exposure that I have gotten to graduate students, professors, and research is not something that all of my peers get to experience, and I am very grateful that GLUE gave me the opportunity to get the most out of being an undergraduate student in engineering.”

**Graduate Participants**

**Participant Demographics.** Demographics of GLUE program graduate participants from the three years of the GLUE program (2003, 2004 and 2005) are summarized in Table 4. Women are participating at a rate of 62 percent compared to the overall College of Engineering graduate enrollment of approximately 21 percent. Minority students (African American, Hispanic and Native American) are participating at a rate of 4 percent matching the overall College of Engineering graduate enrollment.

**Pre-Survey Data.** Graduate students complete an application form that contains questions assessing their research and mentoring experience. Sixty-eight student participants have been surveyed to date from the 2003, 2004 and 2005 GLUE programs. Survey highlights are below:

- 60 percent have mentored undergraduates previously
- 18 percent were mentored by a graduate student during their undergraduate studies
- 63 percent participated in undergraduate research during their undergraduate studies
- 47 percent plan to head into academia
- 26 percent plan to head into industry
- 27 percent are undecided

**Post-Survey Data.** Thirty-four graduate students have completed the GLUE program to date (Spring 2003 and Spring 2004 participants). Post-survey results from completed surveys:

- 20 percent indicated an increase in confidence regarding their skills and abilities
- 33 percent indicated an increase in their planning and project management skills
- 60 percent indicated an improvement in teaching and communication skills

**Participant Feedback.** A sampling of quotes from previous graduate student participants is provided below.

“I realized how much I like teaching; I realized how much I actually knew about my topic and how much I have learned thus far in graduate school. I got help from her in asking questions that were really good and I hadn't thought of yet.”

“Last Spring, I participated in the GLUE program, and it was one of the best experiences I have ever had in college (grad or undergrad). I was at a point in my studies where I both didn’t have the confidence in my knowledge I thought..."
should, yet I was having an increasing number of days where I couldn’t remember why my research was interesting. Everything just seemed tedious and a bit overwhelming. GLUE changed that. Since everything was new to my undergrad, she found everything interesting. Her enthusiasm renewed my enthusiasm, and I think it was a kind of snowball effect. Also, the more I explained things to her, the more confident I felt about my knowledge. If I struggled some to explain things, she never gave me that “You should know this,” look. And rather than being discouraging, my not knowing things was actually positive, because it showed her that you don’t have to know everything to be a grad student (a misunderstanding that discourages many from applying to grad school). My renewed enthusiasm helped me get a lot done this past summer. And, I think this fall might be the first time I’ve truly enjoyed graduate school.”

Partnerships
GLUE has become the most collaborative programs administered through the Women in Engineering Program (WEP) at UT Austin, reaching across the College of Engineering and UT Austin as well as including corporate and government partners. GLUE was born out of collaboration as WEP worked with Dr. Kerry Kinney who developed the concept for the Graduates Linked to Undergraduates in Engineering (GLUE) mentoring program while still a doctoral student at the University of California. Dr. Kinney serves as the faculty instructor for the interdisciplinary course associated with the GLUE program and works with the WEP to recruit the undergraduate and graduate students for the program.

University Partnerships. GLUE has expanded from a pilot program with 13 undergraduate applicants to the current program with 63 undergraduate applicants, dramatic growth in just three years due to the partnerships developed across the College of Engineering and UT Austin. Partnerships enhanced the marketing of the program to students, contributed to the involvement of all College of Engineering departments, and added to the seminar content and management.

In addition to the partnership with Dr. Kinney, WEP works with faculty and department chairs from across the College of Engineering who encourage their graduate students to participate as mentors in the program. For the 2005 GLUE program, the partnership with the Aerospace Engineering and Engineering Mechanics Department is strengthened through a grant from the Texas Space Grant Consortium with Dr. Robert Bishop, Chair of the Aerospace Engineering and Engineering Mechanics Department and co-PI on the grant, identifying and recruiting graduate students throughout the College of Engineering who are working on space based research.

GLUE has been formally institutionalized in the College of Engineering as a General Engineering (GE) course thanks to collaborative efforts with the Associate Dean of Student Affairs for the College of Engineering, Dr. Alvin Meyer, The GE course allows faculty such as Dr. Kinney to teach the course every year as part of their regular teaching load and greatly improving the sustainability of the program by combining faculty time with corporate support and the resources of WEP. For the pilot program in 2003, the seminar was administered through special projects courses in the departments of Mechanical Engineering, Electrical and Computer Engineering, and Civil Engineering, requiring collaborations with department advisors for course enrollment and grade posting.
Corporate and Government Partnerships. Corporate and grant support for the GLUE program has increased twelve-fold since the pilot program in 2003. Initial program sponsors included Applied Materials and BP with $4,500 in funding. With the establishment of the formal course for the program in Spring 2004, sponsorship increased to $23,400 from five corporate sponsors. The Spring 2005 program encompasses all UT Austin College of Engineering departments and sponsorship totals $53,400 from six corporate sponsors and one government-funded consortium sponsor. Sponsorship includes funding for tuition scholarships to cover the tuition cost of the two credit hour course for a number of the participants, materials and supplies including lab books for each undergraduate participant, undergraduate and graduate student coordinators, WEP staff salaries, seminar refreshments and an end of semester celebratory dinner.

GLUE in the Future
WEP intends to continue GLUE into the foreseeable future with limited changes or growth from the Spring 2005 program. The targeted enrollment will continue to be 30 undergraduate students with a maximum enrollment of 35 students. Enrollment goals include a female enrollment of 80 percent and a minority enrollment of 35 percent. WEP will work with UT’s Equal Opportunity in Engineering (EOE) Program in the future to better target minority women for enrollment in GLUE. Sponsorship will be sought on the level of $50,000 to continue supporting the participants with materials, staff and tuition scholarships.

Acknowledgements
Dr. Kerry Kinney developed the concept for GLUE while still a doctoral student at the University of California, Davis where a similar program (Women’s Engineering Link) has been established. The GLUE program was initiated with support provided by the National Science Foundation as part of Dr. Kinney’s NSF CAREER Award under Grant No. 9875881 in addition to corporate supporters Applied Materials and BP. The program was continued in 2004 with support from Boeing, BP, ChevronTexaco, DuPont and General Motors. Funding for the 2005 is being provided by the Texas Space Grant Consortium, Applied Materials, Boeing, General Motors, Halliburton, Kimberly-Clark and Shell. These partners are acknowledged for their generous contributions to the GLUE program.

The expansion of the GLUE program for 2005 is due in part to the partnership with Dr. Robert Bishop, Chair of the Aerospace Engineering and Engineering Mechanics Department, and the support of faculty and administration across the College of Engineering at The University of Texas at Austin. Dr. Alvin Meyer, Associate Dean for Student Affairs in the College of Engineering, is acknowledged for this support in the creation of the General Engineering seminar course for credit. In addition, past and present GLUE undergraduate and graduate participants have contributed to the success through continual feedback, honest assessment, word of mouth marketing and continued involvement.
